Bringing a 5G network in India is the ultimate challenge itself for India. Countries like China and the USA are likely to become the first to provide the services of the internet on 5G speed. These countries have already started the testing process of 5G when we were feeling glad about the introduction of the 4G network. So, we can takeout an idea that how much time it will take to launch 5G network service in India. In some cities, the speed of 4G LTE is slow and working on this speed doesn't make people enthusiastic. It means some parts of India is still not able to use 4G technology properly. The reason could be anything, maybe the more usage of internet among the users or the networks are not properly established.
